

WEEKLY PROJECT PROGRESS REPORT (WPPR)–

For week commencing 7 March 2026

Programme: BCA (Artificial intelligence, Cloud Computing & Devops)

Student Name: Name: MOHAMED RIFAN P

WPPR: 6

Register Number: 23BCAICD052

Internal Guide's Name: : MISS NIHARIKA

MAJOR PROJECT Title:

Cloud Cost Intelligence Platform for Retail

Targets set for the week:

The targets for week six were to complete the final project report (all chapters, screenshots, and references), add 12 screenshots of the running application showing each tab and agent evidence table, prepare a deployment package containing the source code (cloud_cost.py, cci_utils.py, cci_agents.py), a requirements.txt file, and a README.md with installation instructions, conduct a final demo for the internal guide and industry mentor, submit all project deliverables (report, code, presentation slides), and document lessons learned along with future research directions.

Progress/Achievements for the week:

All targets were achieved successfully. The final report was completed – a 50-page document with 12 screenshots, a full appendix containing the CSV schema, sample data, glossary, and installation commands. Screenshots were taken from the live application, including the Overview dashboard, Agents tab with all five findings, Budget Guard evidence table, Anomaly Investigator results, Spend Driver table, Unit Economics ranking, Optimization Scout idle candidates, Insights budget panel, and the synthetic data generator dialog (set to 10,000 rows). The deployment package was zipped and tested on a clean machine to ensure all dependencies installed correctly. The final demo was conducted online; all five agents were demonstrated with real-time data using a 10,000-row synthetic dataset, and the internal guide approved the project with positive feedback. All deliverables were submitted to the college portal. Lessons learned were documented, highlighting the benefits of an agent-based architecture for multi-perspective analytics, the effectiveness of heuristic rules for cost optimisation within a 10,000-row dataset, and the impressive performance of Streamlit’s caching. Future research directions were noted, including multi-cloud support (AWS, Azure, GCP), real-time anomaly alerts via email or Slack, integration with actual CPU/memory metrics for precise idle detection, and the addition of a reserved instance coverage agent.
